

Learner Name

1. Did you use any AI tool(s) to assist with this

☐ No. Why not?

☒ Yes. List the AI tool(s) you used and briefly describe the purpose for which you used the tool(s). (e.g., brainstorming, research, drafting content)

I used Claude AI across all six modules of this capstone for: drafting and formatting the deliverables. Improved writing, running, and debugging the actual pipeline, model, dashboard, and API code; generating real diagrams and charts from computed results rather than mockups; and, in this Final Project specifically, reconciling contradictions across Modules 1-5, building the new monitoring script, Explanation Store, Docker Compose setup, and CI/CD pipeline, and others.

2. To demonstrate effective AI use, please provide your initial prompt(s) and a brief description of the steps you took to refine and iterate on the AI's output for this

Initial prompt: I shared my actual Module 1-5 submissions and the Final Project brief and asked Claude to audit them for contradictions before writing the integration, per the assignment's explicit instruction, rather than summarizing each module in isolation.

I refined it by: (1) Extracted the real text from my submitted PPTX and PDF files rather than relying on memory of earlier drafts, to ground the report in what I actually submitted; (2) I addressed my lecturer's Module 3 feedback that the Integration stage was disconnected from analytics goals, by rewriting that stage's documentation and referencing the fix explicitly in the Final Report; (3) Built and tested the new components (monitoring script, Explanation Store, Docker Compose, CI/CD) rather than only describing them, and ran each one to confirm it worked before writing about it; (4) Verified the word count fell within the range advised; (5) Confirmed the live dashboard URL was reachable and used it directly rather than a placeholder.

3. Reflect on the AI-generated content used in your submission:

What were its key strengths and weaknesses?

Strengths: could execute code, so report claims are computed, not narrated, and it caught real cross-module inconsistencies. Weaknesses: cannot deploy live infrastructure it has no credentials for, and I had to actively verify its explanations matched what I actually built.

How will you improve your prompting for similar tasks in the future to achieve better results?

I will ask upfront for an explicit reconciliation pass across prior deliverables before requesting integrated content, and ask it to flag any assumption it makes instead of using a real project artifact, so I can verify it myself.

4. List at least one source you consulted to verify the AI-generated content in your work.

My own previously graded Module 1-4 submissions and the live dashboard URL (<https://firstbank-customer-segmentation-5fqdeelnmuhxvynun53yg.streamlit.app/>), which I opened myself to confirm it was reachable before it was cited in the report.

5. Did you directly incorporate AI output into your submission, without any modifications?

- ☒ **No.** Describe how you modified the AI-generated content and why those modifications were necessary.

I corrected a figure-caption numbering conflict, verified every statistic against the underlying JSON/log files rather than accepting summary text, replaced placeholder links with my actual deployed URLs, and checked the Integration-stage explanation against my lecturer's Module 3 feedback before accepting it. These were done because AI-generated content can be internally plausible while still containing small factual mismatches that only surface on close review.

- ☐ **Yes.** Reflect on your reasons for directly using the output. How could this change the nature of jobs that heavily require this type of work?
